

ON THE FLIP SIDE

Hart Tank Tender

BEP Marine TS1

*Dometic
DTM4*

The back side of a sensor's monitor panel can be a good indication of how easily the product can be installed and how well it is constructed. The Hart Tank Tender, devoid of wires on the monitor panel (above left), was a cinch to install thanks to its lack of electrical connections. Like many sensor kits we tested, the BEP Marine TS1 (above center)

came with all of the cables and clips needed to install it, including a strain-relief clip to keep the wires from accidentally being pulled out of their connectors. The Dometic DTM4, by comparison, came with no strain relief clips and soldered wire connections that are not as easily serviced by the user.
